

90-Day Entry Plan

Purpose

Learn the current innovation system before prescribing change, establish shared experiment-to-scale decision rules, and leave KPMG with a visible portfolio of evidence rather than disconnected prototypes.

Days 1-30 | Map the proving environment

- Listen across Digital Nexus, engineering, architecture, risk, security, business stakeholders, and platform partners.
- Inventory active proofs of concept, reusable assets, decision gates, unresolved constraints, and adoption dependencies.
- Baseline experiment throughput, decision latency, evidence quality, cost visibility, reuse, and stop discipline.

First outputs

- Stakeholder and decision map
- Current-state experiment portfolio
- Initial risk and authority boundaries
- Baseline scorecard

From Demand to Bounded Proof

Days 31-45 | Frame and bound

- Select a small set of representative opportunities with clear work outcomes and accountable business owners.
- Define human authority, sensitive-data boundaries, evaluation criteria, operational dependencies, and an explicit no-go condition before build.
- Choose build, buy, partner, or reuse pathways with platform and architecture partners.

Days 46-60 | Build minimum enterprise proofs

- Build the smallest artifact capable of testing the business and technical hypothesis.
- Instrument quality, latency, cost, exception patterns, user behavior, and escalation paths.
- Run weekly evidence reviews that separate promising signals from prototype theater.

Decision gate

Each proof exits with one of six explicit decisions: bound first, stop and harvest, platform candidate, fast prototype, controlled proof, or discovery sprint.

Stress, Compound, and Scale

Days 61-75 | Stress the evidence

- Test reliability, security, governance, economics, workflow fit, human override, and failure recovery under realistic conditions.
- Compare expected value with total operating burden, not only model performance.
- Document what must be true for adoption and ownership after the innovation team steps back.

Days 76-90 | Compound the learning

- Promote reusable components, evaluation patterns, decision records, and control mechanisms into a shared capability library.
- Stop weak experiments cleanly while preserving evidence that improves future choices.
- Present an executive portfolio view: scale, reuse, partner, hold, or stop; owner; economics; risk; next decision date.

90-day success measures

- Faster and clearer experiment decisions
- Visible cost and value hypotheses
- Reusable evidence and components
- Named operating owners and adoption commitments
- A credible next-quarter roadmap
